InfoFLASH Produktübersicht

Die verschiedenen InfoFLASH Verfahren unterscheiden sich in der Auswahl und Ermittlung der Quell-Volumes. Diese Ermittlung geschieht in den meisten Verfahren aus Sicht des DB2-Systems.

Jedoch gilt dies nicht bei InfoFLASH BSU. Hier werden die Konstrukte aus DFSMS genutzt (COPYPOOL). In diesen Fällen ist der Kunde für die Richtigkeit und Vollständigkeit verantwortlich. Innerhalb von InfoFLASH gibt es dafür aber Prüfungen.

Im Folgenden erhält der Leser einen Überblick, wie die Auswahl im jeweiligen Verfahren umgesetzt wird.

InfoFLASH classic

Für jedes ermittelte Quell-Volume ist **ein** Ziel-Volume erforderlich.

Die Zuordnung der Ziel-Volumes zu den Quell-Volumes erfolgt mit Hilfe einer Zeichenersetzung an beliebiger Stelle im Quell-VOLSER. Dazu werden die Variablen &subscol und &subschar benötigt.

Regel: Überschreibe den Quell-VOLSER ab der Stelle &subscol mit &subschar.

Das so ermittelte Ziel-VOLSER muss im gleichen SFI (Storage Facility Image oder „Blech“) ONLINE sein. Dies wird während der Verarbeitung geprüft.

Der Parameter &subschar kann als Liste angegeben werden.

In einem solchen Fall, werden die Ziel-Volumes alternierend entsprechend der Liste ermittelt.

Sind alle angegebenen Zeichen benutzt, wird die älteste Version gelöscht und erneut ausgewählt.

Der Kunde hat so die Möglichkeit mehrere FlashCopy-Versionen ONLINE zu halten und ist auf eine schnelle RECOVERY vorbereitet.

Dass die Volume-Dupel kompatibel in ihren physikalischen Eigenschaften sind, liegt in der Verantwortung des Kunden.

Der Parameter &pool2use wird bei InfoFLASH classic nicht unterstützt.

InfoFLASH classic unterstützt keine inkrementellen FlashCopy-Sicherungen.

Für die Auswahl von InfoFLASH classic ist folgende Parameterkombination erforderlich:

MIRROR	= FLASH	-- FLASH, INCR, BACKSYS
FLSHMODE	=	-- FULL, INCR, LAST
SUSPEND	= SETLOAD	-- NOT USING SUSPEND/RESUME
DB2LOC	=	-- DB2 LOCATION NAME
SUBSCHAR	= (#,\$)	-- INCRFLASH CLASSIC
POOL2USE	=	-- SELECT FROM SUBSCHAR
SUBSCOL	= 1	-- COLUMN WITHIN SRCVOL
FLSSKEL	= CPYADR01	-- BLANK, CPYADR01,CPYADRIF

Figure 1 Parameterkombination für InfoFLASH classic

In der SAMPLIB ist ein Beispiel für InfoFLASH classic enthalten: \$\$\$\$PACF

InfoFLASH ICR

Für jedes ermittelte Quell-Volume ist **ein** Ziel-Volume erforderlich.

Die Zuordnung der Ziel-Volumes zu den Quell-Volumes erfolgt mit Hilfe einer Zeichenersetzung an beliebiger Stelle im Quell-VOLSER. Dazu werden die Variablen **&subschar** und **&subscol** benötigt.

Regel: Überschreibe den Quell-VOLSER an der Stelle **&subscol** mit **&subschar**

Das so ermittelte Ziel-VOLSER muss im gleichen SFI (Storage Facility Image oder „Blech“) ONLINE sein. Dies wird während der Verarbeitung geprüft.

Der Parameter **&subschar** kann als Liste angegeben werden.

Welches Volumes letztlich als Zielvolume ausgewählt wird, ist im Parameter **&pool2use** hinterlegt. **&pool2use** ist dann eine Untermenge von **&subschar**. Für das gewählte Volume wird die letzte (einige) Version zu Beginn der Verarbeitung gelöscht und neu erstellt.

Welche Art der Beziehung zwischen den Volumes aufgebaut wird, hängt vom Parameter **&flshmode** ab.

Wählbar ist:

- a) FULL nonpersistent relation mit COPY FULL
- b) INCR persistent relation mit COPY FCINCREMENTAL
- c) LAST nonpersistent relation mit COPY FCINCREMENTALLAST

Der Kunde hat die Möglichkeit mehrere FlashCopy-Versionen ONLINE zu halten.

So ist es möglich eine oder mehrere FULL Versionen zwischen zwei inkrementellen FlashCopy-Abläufen zu erstellen.

Grund: Für inkrementelle FlashCopies wird IBM-seitig nur eine Relation unterstützt.

Mit mehreren ONLINE-Versionen ist man auf schnelle RECOVERY vorbereitet

Dass die Volume-Dupel kompatibel in ihren physikalischen Eigenschaften sind, liegt in der Verantwortung des Kunden.

Für die Auswahl von InfoFLASH ICR ist folgende Parameterkombination zwingend:

MIRROR	= INCR	-- FLASH, INCR, BACKSYS
FLSHMODE	= FULL	-- FULL, INCR, LAST
SUSPEND	= SUSPEND	-- USING SUSPEND/RESUME
DB2LOC	=	-- DB2 LOCATION NAME
SUBSCHAR	= (\$,#)	-- INCRFFLASH INCR FULL
P00L2USE	= #	-- SELECT FROM SUBSCHAR
SUBSCOL	= 1	-- COLUMN WITHIN SRCVOL
FLSSKEL	= CPYADRIF	-- BLANK,CPYADR01,CPYADRIF

Figure 2 Parameterkombination für InfoFLASH ICR

In der SAMPLIB sind Beispiele für InfoFLASH ICR enthalten:

- \$\$\$\$PAIF - ICR FULL
- \$\$\$\$PAII - ICR INCR
- \$\$\$\$PAIL - ICR LAST

InfoFLASH BSU

BACKUP SYSTEM utility

Mit dem BACKUP SYSTEM Utility werden mit Hilfe von DFSMShsm die Platten mit DB- und LOG-Informationen kopiert. Ab z/OS Version 1.8 lässt sich auch der Abzug der Platten auf HSM-verwaltete Bänder umsetzen.

Für die Auswahl von InfoFLASH BSU ist folgende Parameterkombination zwingend:

POOL2USE	=	-- SELECT FROM SUBSCHAR
FLSHMODE	= INCR	-- FULL, INCR
SUSPEND	=	-- NOT USING SUSPEND/RESUME
TSOWITHD	= YES	-- USING ICKDSF FCWITHDR
HSMSTC	= HSM	-- STC NAME, ONLY BACKSYS
HSMBCDS	= HSM.BCDS	-- BCDS DSN, ONLY BACKSYS
MIRROR	= BACKSYS	-- FLASH, INCR, BACKSYS
DB2LOC	= IDF0LOC	-- DB2 LOCATION NAME
SUBSCHAR	=	-- INCRFLASH BACKSYS
SUBSCOL	=	-- COLUMN WITHIN SRCVOL
FLSSKEL	=	-- BLANK, CPYADR01, CPYADRIF

Figure 3 Parameterkombination für InfoFLASH BSU

In der SAMPLIB sind Beispiele für InfoFLASH BSU enthalten:

\$\$\$\$PABF - BSU FULL
\$\$\$\$PABI - BSU INCR

Vorbereitende Maßnahmen

Alle Dateien, die mit BACKUP SYSTEM gesichert werden sollen, müssen SMS-managed sein. Die niedrigste unterstützte z/OS-Version ist 1.7. für die Nutzung der HSM Funktion „RESTORE von DUMPCLASS“ ist mindestens z/OS 1.8 erforderlich.

Für die BCDS-Datei ist als maximum recordlength 6544 einzustellen.

Literatur: Redbook SG24-7069-00 DFSMShsm Fast Replication Technical Guide
Kapitel 5.1.2 Software coexistence considerations

Vor dem Start des Utilities sollte die Richtigkeit der COPYPOOL-Definitionen für den DB- und LOG-Pool geprüft werden.

```

Figure 4 FRBACKUP PREPARE

F dfsmshsm,FRBACKUP CP(DSN\$locname\$LG) PREPARE analog

Informationen zu den Copypools erhält man mit:

F dfsmshsm,LIST CP(DSN\$locname\$DB) TERM

Figure 5 LIST COPYPOOL DB

F dfsmshsm,LIST CP(DSN\$locname\$LG) TERM

Figure 6 LIST COPYPOOL LG

Algorithmus für Volumeauswahl

Die Zuordnung der Zielvolumes zu den Quellvolumes erfolgt entweder beim FRBACKUP PREPARE oder sofort bei Ausführung von BACKUP SYSTEM.

Dabei wird in der Reihenfolge der beim Copypool definierten SMS-SG vorgegangen.

Die Liste der Volumes wird SMS-SG weise in EBCDIC Sortierung abgearbeitet. Die devnum des Zielvolumes wird aus den ebenfalls EBCDIC sortierten Volumes der angegebenen BACKUP COPY POOL SG bestimmt.

Informationen finden Sie im **DFSMShsm Storage Administration** (SC35-0421-xx).

Kapitel 6 „Availability management of SMS-managed storage“

in der Sektion „Preparing for the fast replication backup“.

CATALOG CAPTURE

Die Funktion CATALOG CAPTURE wird an der Definition für den Copypool eingestellt. Es wird dabei ein Abbild des/der ICF-Benutzerkataloge(s) erstellt.

Wurde die Erstellung als REQUIRED deklariert und bei der Erstellung gibt es Probleme, kann es dazu führen, dass die Volumes des Copypools automatisiert initialisiert werden.

Negativer Effekt dabei ist, dass damit die inkrementellen Beziehungen abgebaut sind und man sich ungeplant eine BackGroundCopy über den gesamten Copypool einhandelt.

Figure 11 SYSLOG HSM

RESTORE SYSTEM utility

Mit Hilfe des RESTORE SYSTEM Utilities lassen sich SYSTEM LEVEL Sicherungen wiederherstellen, ab z/OS Version 1.8 auch direkt von den HSM-verwalteten Bändern.

Vorbereitende Maßnahmen

Vor dem Einsatz von RESTORE SYSTEM müssen mindestens folgende Bedingungen erfüllt sein:

- a) mittels BACKUP SYSTEM ist mindestens eine COPYPOOL-Version erstellt worden.
- b) Es muss im BSDS ein SYSPITR Eintrag mit einer gültigen LOG-Adresse eingetragen werden. Es liegt in der Verantwortung des Anwenders diese zu finden.
Hinweise dazu finden Sie in der IBM Literatur.
- c) Es ist sicherzustellen, dass die zum DB-Pool gehörenden ICF-Kataloge nicht allokiert sind.

Unterstützt werden kann der Anwender durch die ISPF-Anwendung des InfoDesign Produktes „InfoMAT“.

Auf Wunsch wird aber auch JCL bereitgestellt, die diese LOG-Adresse, auf Basis einer Zeitangabe ermittelt. Diese muss dann vor dem Submit des Jobs eingetragen werden.

Durchführung

Beim RESTORE SYSTEM Utility wird nur der DB-Pool zurückgesetzt.

Beispieljob mit RESTORE SYSTEM Utility Aufruf:

```
//RESTSYS EXEC PGM=DSNUTILB,PARM='IDF0,IDX0P011'  
//STEPLIB DD DISP=SHR,DSN=&SDSNLOAD  
//SYSPRINT DD SYSOUT=*  
//SYSIN DD *  
RFSTORF SYSTEM
```

DSNU010I - UTILITY EXECUTION COMPLETE, HIGHEST RETURN CODE=4
```

Figure 13 SYSPRINT RESTORE SYSTEM

Nacharbeiten

Basierend auf der Meldung DSNU1629I sind vom Anwender die betroffenen Objekte zu ermitteln und danach den PENDING Status aufzuheben.

InfoFLASH bietet hier einen Automatismus, diese Aufgabe **vollständig** und ressourcenoptimiert zu lösen.

InfoFLASH TSR

Voraussetzungen

InfoFLASH muss installiert und lizenziert sein.
InfoFLASH TSR ist an keine Hardware gebunden.

Die Spiegelvolumes werden mit ADRDSSU.DUMP gesichert, d.h. die Wiederherstellung aus einem InfoFLASH-Ablauf mit **&ignoffl = YES** kann nicht verwendet werden. Das Ausgabemedium kann TAPE als auch DASD sein.

Es ist eine DB2-Tabelle **&idcreate.FLTSRDC** zu erstellen.
Für die Pflege dieser Tabelle ist ein SQL-Trigger zu definieren.

Implementierung

Die benötigten Sourcen für REXX, MLIB und SLIB werden im vorhandenen InfoMAT / InfoFLASH-Umfeld bereitgestellt (namentliche Unterscheidung).

Zu den bereits eingeplanten Jobs werden weitere zwei Jobs hinzugefügt, wobei der erste die Generierung eines zweiten Jobs vornimmt.

Für die benötigten SQL-Objekte werden DDL Anweisungen mitgeliefert.

Die Funktionalität von TSR steht erst mit dem ersten Durchlauf zur Verfügung, eine Übernahme bestehender FLASH-Zeitpunkte kann nicht erfolgen.

Funktionalität

InfoFLASH TSR dient in erster Linie der RECOVERY von Einzelobjekten.

Für eine POINT-IN-TIME RECVOERY **muss** eine andere InfoFLASH Variante benutzt werden.

Ziel von InfoFLASH TSR ist eine Reduzierung der COPY-Abläufe bei voller RECOVERY-Fähigkeit. In einem ersten Schritt könnten die COPY FULL NO (incremental imagecopy) Applikationen ausgesetzt werden.

Da multivolume-Dateien beim RESTORE ein spezielles Vorgehen erfordern, werden diese zunächst ermittelt und dann zusätzliche logische Sicherungen angestoßen.

Nach der Sicherung der Ziel-volumes auf Band wird im DB2 ein Inhaltsverzeichnis aller gesicherten Platten hinterlegt.

Die erstellten Jobs können nun schedulergestützt submittet werden.

Jobfolge Sicherung

\$\$\$\$V#GC Generierungssjob zur Sicherung der multivolume-Dateien.
\$\$\$\$VTAB Sicherung der ermittelten multivolume-Dateien mit ADRDSSU.DUMP.

Jobfolge Recovery

\$\$\$\$V#GD Generierung RECOVER-Jobs.
\$\$\$\$Xabc Jobs für RESTORE und RECOVER LOGONY.

InfoFLASH Tabellen

Die DB2-Tabellen werden mit jeder Abarbeitung um eine Reihe von Sätzen erweitert.
Dabei gilt für die Anzahl Sätze:

x = Anzahl Flashcopy – Abläufe

n = Anzahl words(&subschar)

t = Anzahl vorhandener Tapesicherungen je Flashcopy - Ablauf

FLSDASDI	n * Anzahl(DASD)
FLSHADOW	n * Anzahl(DASD)
FLSHIST	X
FLSINCR	x * Anzahl(DASD) + x
FLSTAPE	x * Anzahl(DASD)
FLTSRDC	t * Anzahl(Dateien)
FLSBCDS	X * BCDS entries
FLSTSPRT	CLOB für SYSTSPRT DD

Job-Generierung allgemein

PARMLIB(CPYGENMA)

Dieses Member wird vom Job \$\$\$\$V#G0 bei der Generierung der statischen Jobs benutzt. In den Sektionen sind die jeweils zu erstellenden Jobnamen erhalten.

Die Zeichenkette \$\$\$\$ steht dabei für das zu benutzende DB2-Subsystem, welches sowohl drei- als auch vierstellig sein kann. Mit dem Kunden wird abgestimmt, ob mit dieser Namensgebung sieben- oder achtstellige Jobnamen generieren werden sollen.

```

```

CNTL(\$\$\$\$SETF)

Mit den Definitionen in diesem Member werden zusätzliche MVS-Variablen definiert, und ggf. auch InfoMAT-Variablen für die Nutzung von InfoFLASH überschrieben.

```
/* $$$$SETF  PARAMETERS CONCERNING INFOFLASH           INFVERS=V11R2M000
// SET IDFLSPR=IKJIF112
// SET PARMLIB=INFOMAT.parmlib
// SET REXBASE=&PARMLIB($$$$PARM)
// SET GENPARM=&PARMLIB(CPYGENMA)
// SET DASDIN=&PARMLIB($$$$DASD)
// SET MINLRSN=&PARMLIB($$$$MINL)
// SET HSMBCDS=DFSMSHSM.BCDS
// SET TLIB=INFOMAT.tlib
// SET PROFPPREF=INFOMAT.workpref
// SET PARMMEM=$$$$PA
```

CNTL(\$\$\$\$SETP)

Oftmals ist es erforderlich verschiedene Parametersätze vorzuhalten, die je nach Bedarf ohne manuelle Eingriffe abgerufen werden müssen. Dafür eignet sich die Verwendung des Jobs **\$\$\$\$V#pv**. Aus den letzten beiden Stellen des Jobnames (**pv**) leitet sich ein Membername **(\$\$\$\$PApv)** in der Parameterdatei ab, der die jeweilig geänderte Parameterversion enthält.

/* \$\$\$\$SETP PARAMETER SET BY ROLLOUT	16/07/31 00:00:00
-----------------------------------------------	-------------------

Weitere Informationen entnehmen Sie bitte dem Kapitel Parameterverarbeitung im Benutzerhandbuch zu InfoFLASH v91.

PARMLIB(\$\$\$\$DASD)

In der Parameterdatei wird bei der Generierung **(\$\$\$\$V#G2)** ein Member mit Informationen zu den ermittelten Quell-, Zielvolumes und den verwendeten Poolparametern erstellt.

* generated by InfoMAT 7 Jun 2016 12:23:32
* selected FLASH-pool: #
* SRCVOL SRCADD TGTVOl TGTADD SRCSIGNATUR
*
IDF000 602F #DF000 6459 é¹È...£

.
IDFCV020 6021 #IDFCV020 6455 öñx o l

&genlib(\$\$\$\$VFT)

Dieses Member enthält schedulerspezifische Angaben zu den zu submittenden Jobs.

Beispiel für Automic©:

Jobname, DB-Name, PAGESET-Name, Partitionsnummer, Ressourcenbedarf, Bandstationen, Priorität

IDFCV020, DBNAME.SPACENAM.PARTNR, 10, 0, 99, DUMP,
IDFCV021, DBNAME.SPACENAM.PARTNR, 10, 0, 99, DUMP,
.
IDFCV031, DBNAME.SPACENAM.PARTNR, 10, 0, 99, DUMP,

Anmerkung: Die Werte für Bandstation und Priorität werden nur als Platzhalter verwendet und erst auf Kundenanforderung aktiviert.

PARMLIB(\$\$\$\$MINL)

Dieses Member enthält eine Übersicht zu den SUSPEND-Zeitpunkten, die für einen möglichen RESTORE zur Verfügung stehen.

*** restorable SUSPEND_LRSN for IDF0 at 7 Jun 2016 12:26:00 ***
LRSN TIMESTAMP ANZAHL_DASD OFFLOADED ONLINE STATUS
D0DBDB4AB593 2016-06-07-12.23.41 12 NO YES IGNORED
D0DBAAC90C54 2016-06-07-08.46.38 12 YES YES OKAY
D0DAE83802 2016-06-06-13.22.12 12 YES NO OKAY

LRSN = SUSPEND LRSN
 TIMESTAMP = SUSPEND Zeitpunkt
 ANZAHL = Anzahl der kopierten Volumes
 OFFLOADED = Zielvolumes sind auf Band gesichert
 ONLINE = Zielvolumes enthalten den Stand des dazugehörigen SUSPEND Zeitpunktes
 STATUS = Bandsicherung wurde ausgesetzt

Job-Übersicht

In den nachfolgenden Tabellen soll die Arbeitsweise der Jobs näher erläutert werden. Unter INPUT wird dabei auf die Parametrisierung unter den DD-Namen REXBASE, REXSYSIN oder \$\$\$\$PAPv aufgeführt. Die aufgeführten DD-Namen werden in der genannten Reihenfolge durchsucht.

Unter OUTPUT wird auf die wichtigsten Meldungen der Jobs hingewiesen. Gibt es verschiedene Möglichkeiten des Stepverlaufs enthält die Zeile mit dem Steppnamen mehrere Meldungsfenster.

InfoFLASH RECOVERY

Die nachfolgend aufgeführten Jobs werden benötigt um eine RECOVERY basierend auf FlashCopy-Sicherungen durchzuführen.

\$\$\$\$X#XC

Das JCL für diesen Job wird vom \$\$\$\$V#G0 generiert.

Den Kern bildet dabei das JCL des Jobs \$\$\$\$XCAT, welcher während des letzten InfoMAT-Ablaufes erstellt wurde. Ausgeführt wird der Teil des RECOVER CATALOG aber nur, wenn das vorgeschaltete DISPLAY RESTRICTED den Bedarf anzeigt.

Input

STEP	InfoFLASH	Bemerkung
CPYXDRES		
\$\$\$\$XCAT		nur bei RC 4 aus CPYXDRES

Job-Wiederanlauf Übersicht

Allgemeine Hinweise

Während der Durchführung von InfoFLASH-Abläufen werden verschiedene Objekte verändert.

PARMLIB(ssidDASD)

Sowohl der Job \$\$\$\$Z980 als auch \$\$\$\$V#G7 verändern das Member \$\$\$\$DASD.

UNLOAD-Dateien der InfoFLASH-Tabellen

Sowohl der Job \$\$\$\$Z980 als auch \$\$\$\$V#G7 legen sequentielle Dateien in der Form **&workpref.FLS*.Djjddd** an. Darin enthalten sind DSN1COPY Bestände einiger InfoFLASH-Tabellen.

Der benutzte Tagesstempel (Djjddd) wird bei der Generierung der Jobs erzeugt.

Im Job \$\$\$\$Z980 wird geprüft, ob diese Datei angelegt sind. Wenn ja, wird angenommen, dass es bereits einen Erstellungslauf am gleichen Tag gab und das Entladen wird übersprungen.

FLSDASDI-Tabelle

Sowohl der FrontEND als auch die \$\$\$\$W-Jobs fügen bei RECOVERY auf einen OFFLINE SUSPEND-Zeitpunkt neue Sätze in die FLSDASDI ein. Diese Sätze beinhalten keine gültigen devnum's, sondern "CUAA" als Platzhalter.

Diese Sätze sind vor einem erneuten Aufruf zu entfernen.

Das PARMLIB-Member und die Tabelle FLSDASDI werden durch die Rückkehr zum normalen Betrieb automatisch bereinigt.

Für alle Jobs, die in der nachfolgenden Übersicht **nicht** enthalten sind, gilt:
Job ist ohne Vorbedingungen RESTART-fähig

\$\$\$\$V#G2

INFF140E

Abbruch im Step CPYBSUDC | CPYVLST1 | CPYIFCOL mit Fehlermeldung INFF140E.

Dieser Fehler kann entstehen:

- a) Aus dem vorangegangenen Ablauf war mindestens ein "DUMP auf TAPE"-Job (\$\$\$\$V02n) nicht erfolgreich. Dadurch enthält die Spalte OFFLOAD_STATUS in der Tabelle FLSDASDI mindestens einmal den Wert "PENDING".
- b) Es wurden \$\$\$\$W-Jobs gestartet (zum Beispiel testweise), ohne die PIT RECOVERY durchzuführen. Durch diesen RESTORE-Job werden die Bandinformationen mit dem OFFLOAD_STATUS = „RESTORED“ in die FLSDASDI übernommen.

Für beide Fälle wird ein SQL-Member erzeugt, welches helfen soll, die Situation zu bereinigen. Es liegt in der Verantwortung des Kunden die Situation zu überprüfen und den Lösungsvorschlag einzusetzen. Im Zweifelsfall stehen Ihnen die Mitarbeiter von InfoDesign gern zur Verfügung.

STEP		Ursache
CPYBSUDC	<pre> CPYBSUDC 11:17:59 *** check OFFLOAD ***** INFF147I 11:17:59 FLSDASDI: 8, FLSHIST: 10 volumes at 2015-10-02-10.14.33.000000 INFF140E 11:17:59 The number of offloaded volumes in FLSDASD and FLSHIST do not match Number of OKAY offloaded volumes in FLSDASDI: 8 . Eine mögliche Ursache könnte sein:

DFSMShsm erwartet für die Durchführung von inkrementellen. BACKUP SYSTEM, dass entweder keine Beziehung existiert, oder deren Richtung von Quell- nach Zielvolume eingestellt ist.

Nach einer PIT RECOVERY unter Verwendung von FCINCVFY(RV) stehen die Relationen für den DB-Copypool nicht wie erwartet, sondern Zielvolume → Quellvolume.

Dies lässt sich überprüfen:

- mit dem InfoFLASH Zusatztool "InfoFLASH FCopy Monitor" oder
- TSO FCQUERY Befehlen oder
- ICKDSF.FLASHCPY QUERY

Hier ein Beispiel für "InfoFLASH FCopy Monitor":

```

PARMLIB: INFOFLSH.V11R1M0.ROLLOUT.PARM.PIT -   DASDIN: IDFCDASD .

```

\$\$\$\$V#G7

1. Abbruch in einem der UNLOAD-Steps
Löschen der bereits erstellten UNLOAD-Dateien: &workpref.FLS*.Djjddd
Job von vorn wiederaufsetzen
2. Abbruch im Step CPYRSTXF
Job von vorn wiederaufsetzen

\$\$\$\$Z980

- 1 a) Abbruch im Step CPYXFLS1 mit RC 16 **no records with ... found in FLSDASDI**
Wird festgestellt dass die Sätze in der FLSDASDI enthalten sind, bitte den Tablespace mit STOP/START durchstarten.
Job von vorn wiederaufsetzen

\$\$\$\$P011

Wurde der Job im Stepp FCWITHDR mit FCWITHDR-Statements unter //SYSIN DD generiert, lässt er sich nicht ohne manuellen Eingriff wiederholen.

Grund:

Die aufzulösenden Volume-Beziehungen existieren nach erfolgreicher Ausführung nicht mehr.

RACF

Für das Kopieren der Volumes wird das Schlüsselwort **ADMIN** im **ADRDSU COPY** Statement benutzt. Dafür wird **ACC(READ)** für die nachfolgend aufgeführten Profile benötigt.

Profile bei Angabe von ADMIN

STGADMIN.ADR.STGADMIN.COPY

Erlaubt das Kopieren ohne READ-Berechtigung für die Quell- und ALTER für die Zieldateien.

STGADMIN.ADR.STGADMIN.DUMP

Erlaubt das Abziehen ohne READ-Berechtigung für die Quelldateien.

"Does not give you the authority to delete a data set."

STGADMIN.ADR.STGADMIN.RESTORE

Erlaubt das Wiederherstellen ohne ALTER-Berechtigung für die Quell- und Zieldateien.

Batch SYSIN	Job	Bemerkung
ADRDSU.COPY	\$\$\$\$V00n	nicht für BSU
ADRDSU.DUMP	\$\$\$\$V02n	
ADRDSU.RESTORE	\$\$\$\$W02n	RECOVERY

Kann die Berechtigung nicht erteilt werden, muss vom Kunden sichergestellt sein, dass der Submitter Zugriff auf die alle Dateien auf den zu kopierenden Volumes hat.

ACC Level ohne ADMIN

READ für die Dateien auf den Quell- und ALTER für die Zieldateien.

```
ICH408I USER(userid ) GROUP(group) NAME(user info )
Dataset CL(DATASET ) VOLvolser
INSUFFICIENT ACCESS AUTHORITY
FROM h1q.** (G)
ACCESS INTENT(READ ) ACCESS ALLOWED(NONE )
```

InfoFLASH benutzt dies in folgenden Fällen:

Anhang

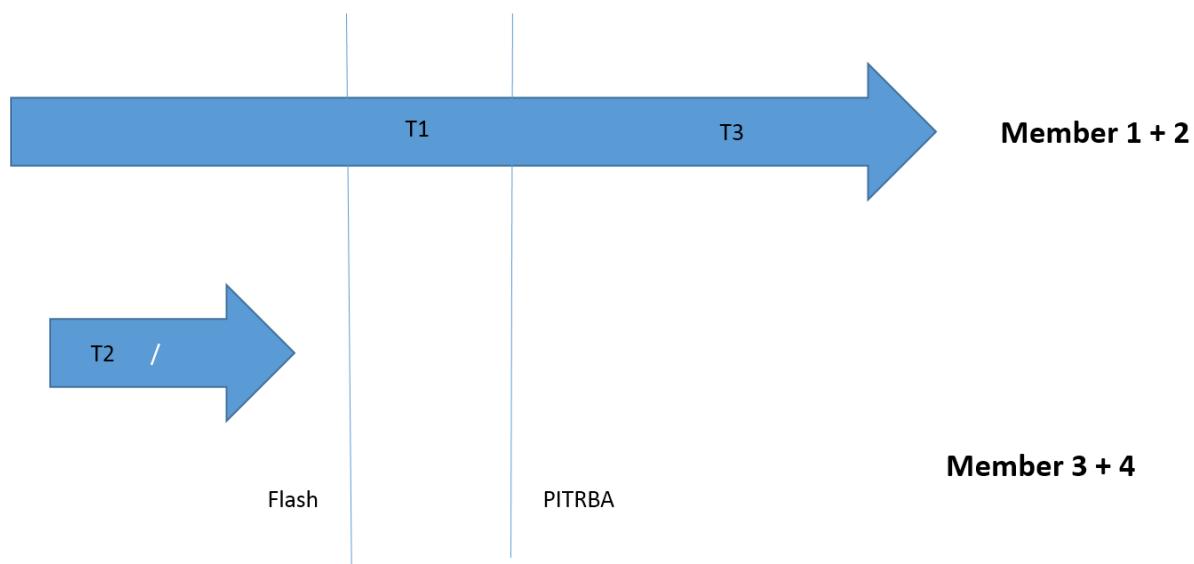

Start DB2 DATA SHARING bei eingetragener SYSPITR

Test Point in Time Recovery auf Basis einer mit InfoFlash erstellen Sicherung.

Verwendet wurden ausschließlich vom InfoMat generierte Jobs gemäß dokumentiertem Jobablauf.

Hier nachmals die Zusammenfassung der Erkenntnisse eines Kunden:

Ausgangssituation dort:

Der Ablauf dort:

1. Start member 1+2
2. Quiesce member 3+4
3. Recover
4. Alles ist gut
5. Start member 3+4: Fehler wg SYSPIZRBA ist noch aktiv
6. DSNJU004: CRESTART CANCEL
7. Start Member 3+4
8. Alles ist gut

InfoDesign

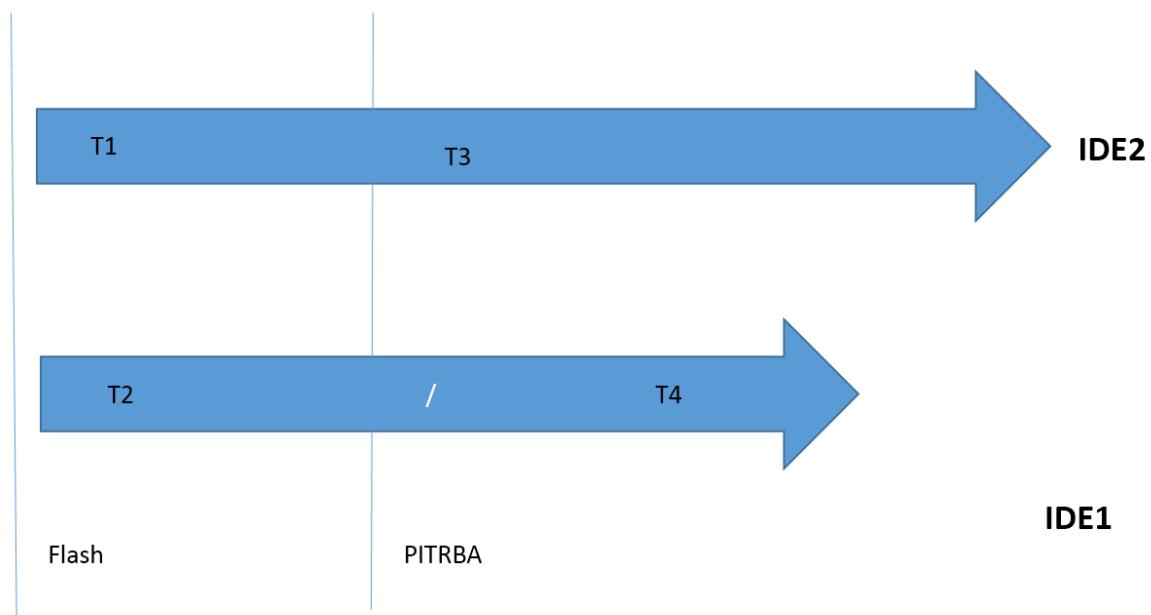

Von InfoDesign empfohlener Ablauf:

1. Start member 1+2+3+4
2. Recover
3. Alles ist gut

Begründung: Der empfohlene Ablauf ist immer in jeder Situation erfolgreich. (siehe auch nächstes Szenario)

InfoDesign Test:

Ausgangssituation hier:

Test 1:

Start IDE2

*46 DSNR020I -IDE2 DSNRRUTT START MEMBER IDE1, OR REPLY 'NO' OR 'QUIESCED'

R 46, QUIESCED

Quiesce IDE1

*47 DSNR030I -IDE2 DSNRRUTT WILL CONTINUE WITHOUT THE IDE1 MEMBER'S LOG, REPLY REPLY 'YES' OR 'NO'

DSNR030I csect-name WILL CONTINUE WITHOUT THE member MEMBER'S LOG, REPLY 'YES' OR 'NO'

Explanation: The reply to message DSNR020I was 'QUIESCED'. This message is issued as a reminder that group restart will continue **without using the log** from the identified member.

If you are sure that the identified member was quiesced the last time it was started, that is, it was stopped with a -STOP DB2 MODE(QUIESCE) command and it stopped with no indoubt units of recovery and no distributed resynchronization responsibility, then reply 'YES'; otherwise, reply 'NO'.

System action: This group member waits for a valid reply to this message.

- v If the reply is 'YES', group restart continues **without using the log** from the identified member.
- v If the reply is 'NO', message DSNR020I is reissued to allow you to enter a different response.

Nochmals REPLY YES. Also einverstanden, ohne Log vom IDE1 zu starten

Dann scheitert der RESTORE SYSTEM LOG ONLY mit dieser Meldung:

15:30:53.98 DSNUVARS - RESTORE SYSTEM UTILITY FAILED BECAUSE ONE OR MORE NON-DOR

OR NOT NORMALLY QUIESCED STATE. THOSE MEMBERS ARE:

01

0:54.01 DSNUGBAC - UTILITY EXECUTION TERMINATED, HIGHEST RETURN CODE=8

InfoDesign

Gut, das der RESTORE scheitert, weil sonst Transaktion T2 verschwunden wäre.

Test 2:

1. Start IDE2
2. Start IDE1
3. Recover
4. Alles ist gut

Dies ist in jeder Situation das von InfoDesign empfohlene Vorgehen, weil es in jeder Situation funktioniert.

Test 3:

1. Kein SYSPITRBA für IDE1
2. Start IDE2
3. (keine Aufforderung von IDE2, das IDE1 zu starten)
4. Recover
5. Alles in Ordnung, T1 + T2 vorhanden T3 + T4 nicht
6. Start IDE1
7. Immer noch alles in Ordnung

Dieses Vorgehen wird NICHT empfohlen. Es ist nicht dokumentiert und es ist fraglich, ob es in jeder Situation oder in der Zukunft funktionieren wird.
